

Symfony Framework

Santosh Kalwar, 18.04.2024

Symfony Topics

General Discussions

PHP Final Reflection Quiz

- What is MVC?
- Why use a PHP framework?
- Modern PHP Frameworks

Composer basics

- What is a composer?
- and how to use it

Symfony framework

- What is Symfony?
- How to install and use Symfony?

Symfony installation and setup

- Check your environment
 - Computer, IDE, Terminal
 - Git
 - PHP > 7.3
 - Composer (to manage dependencies)
 - Symfony CLI

MVC - What is it?

M

V

C

What Is
It?

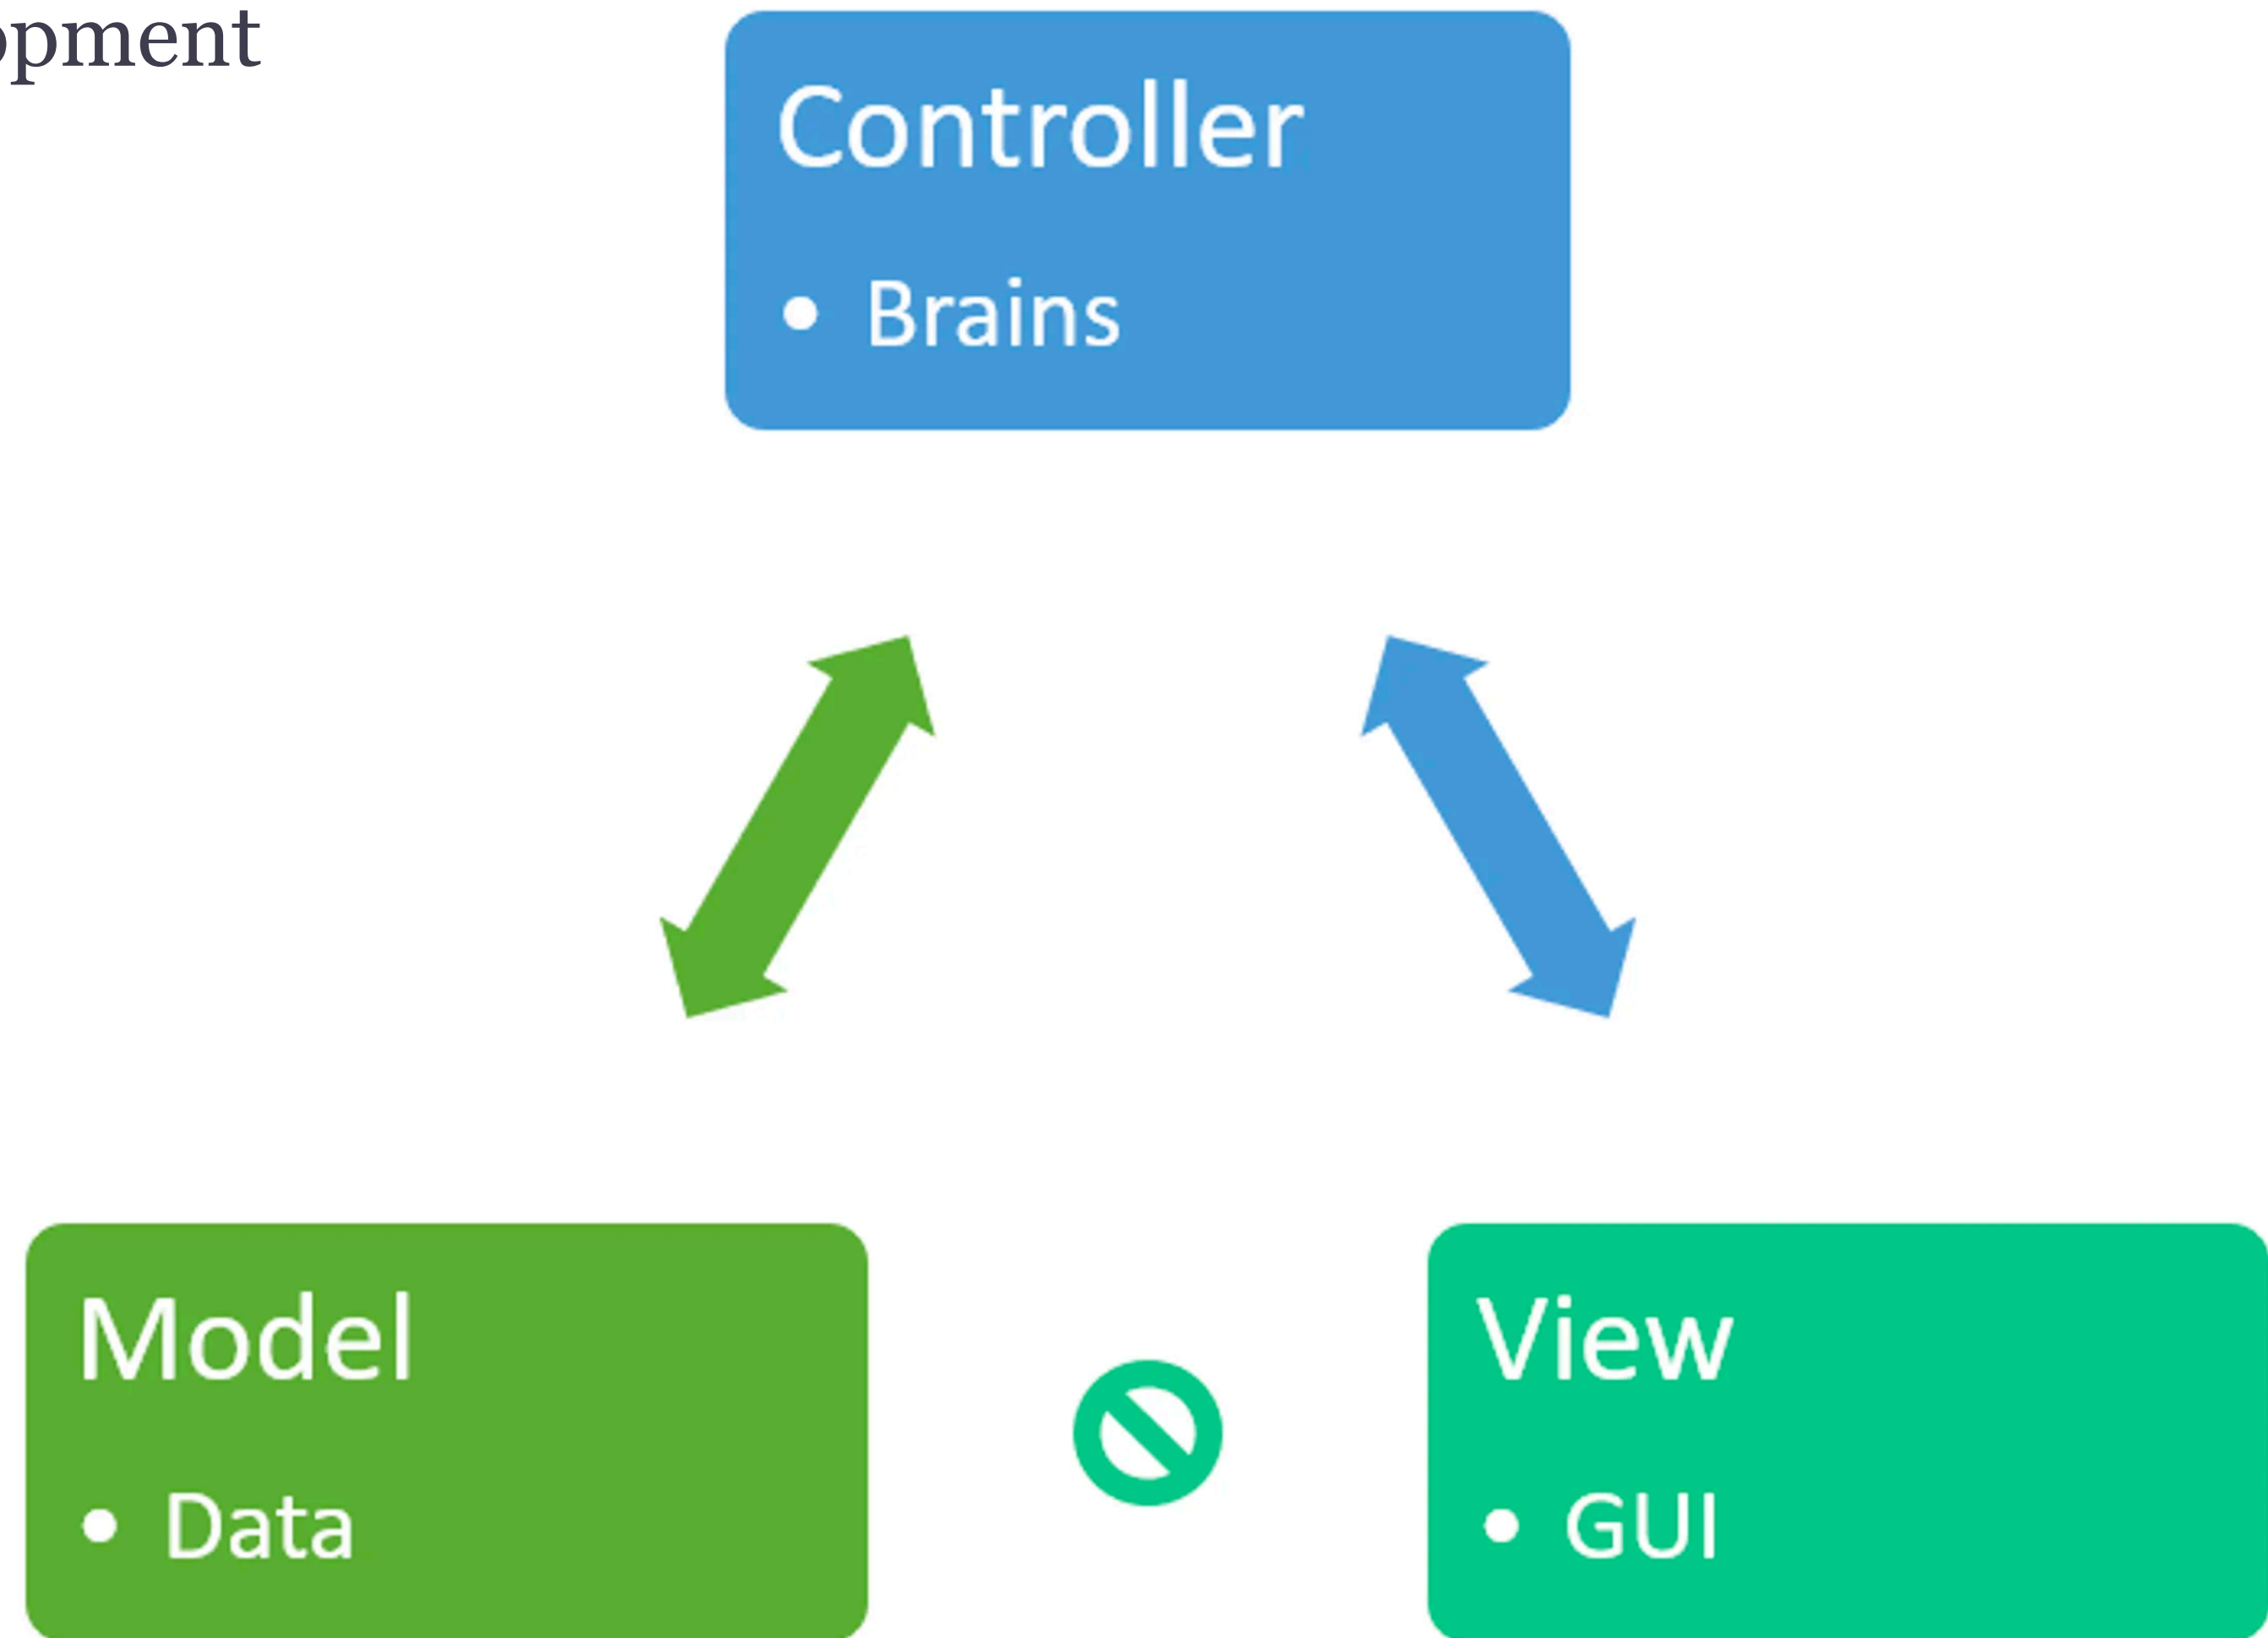

MVC - MODEL VIEW CONTROLLER

software design patterns for app and web development

Model: stores & manages data

View: Graphical User Interface

Controller: Brains of the application

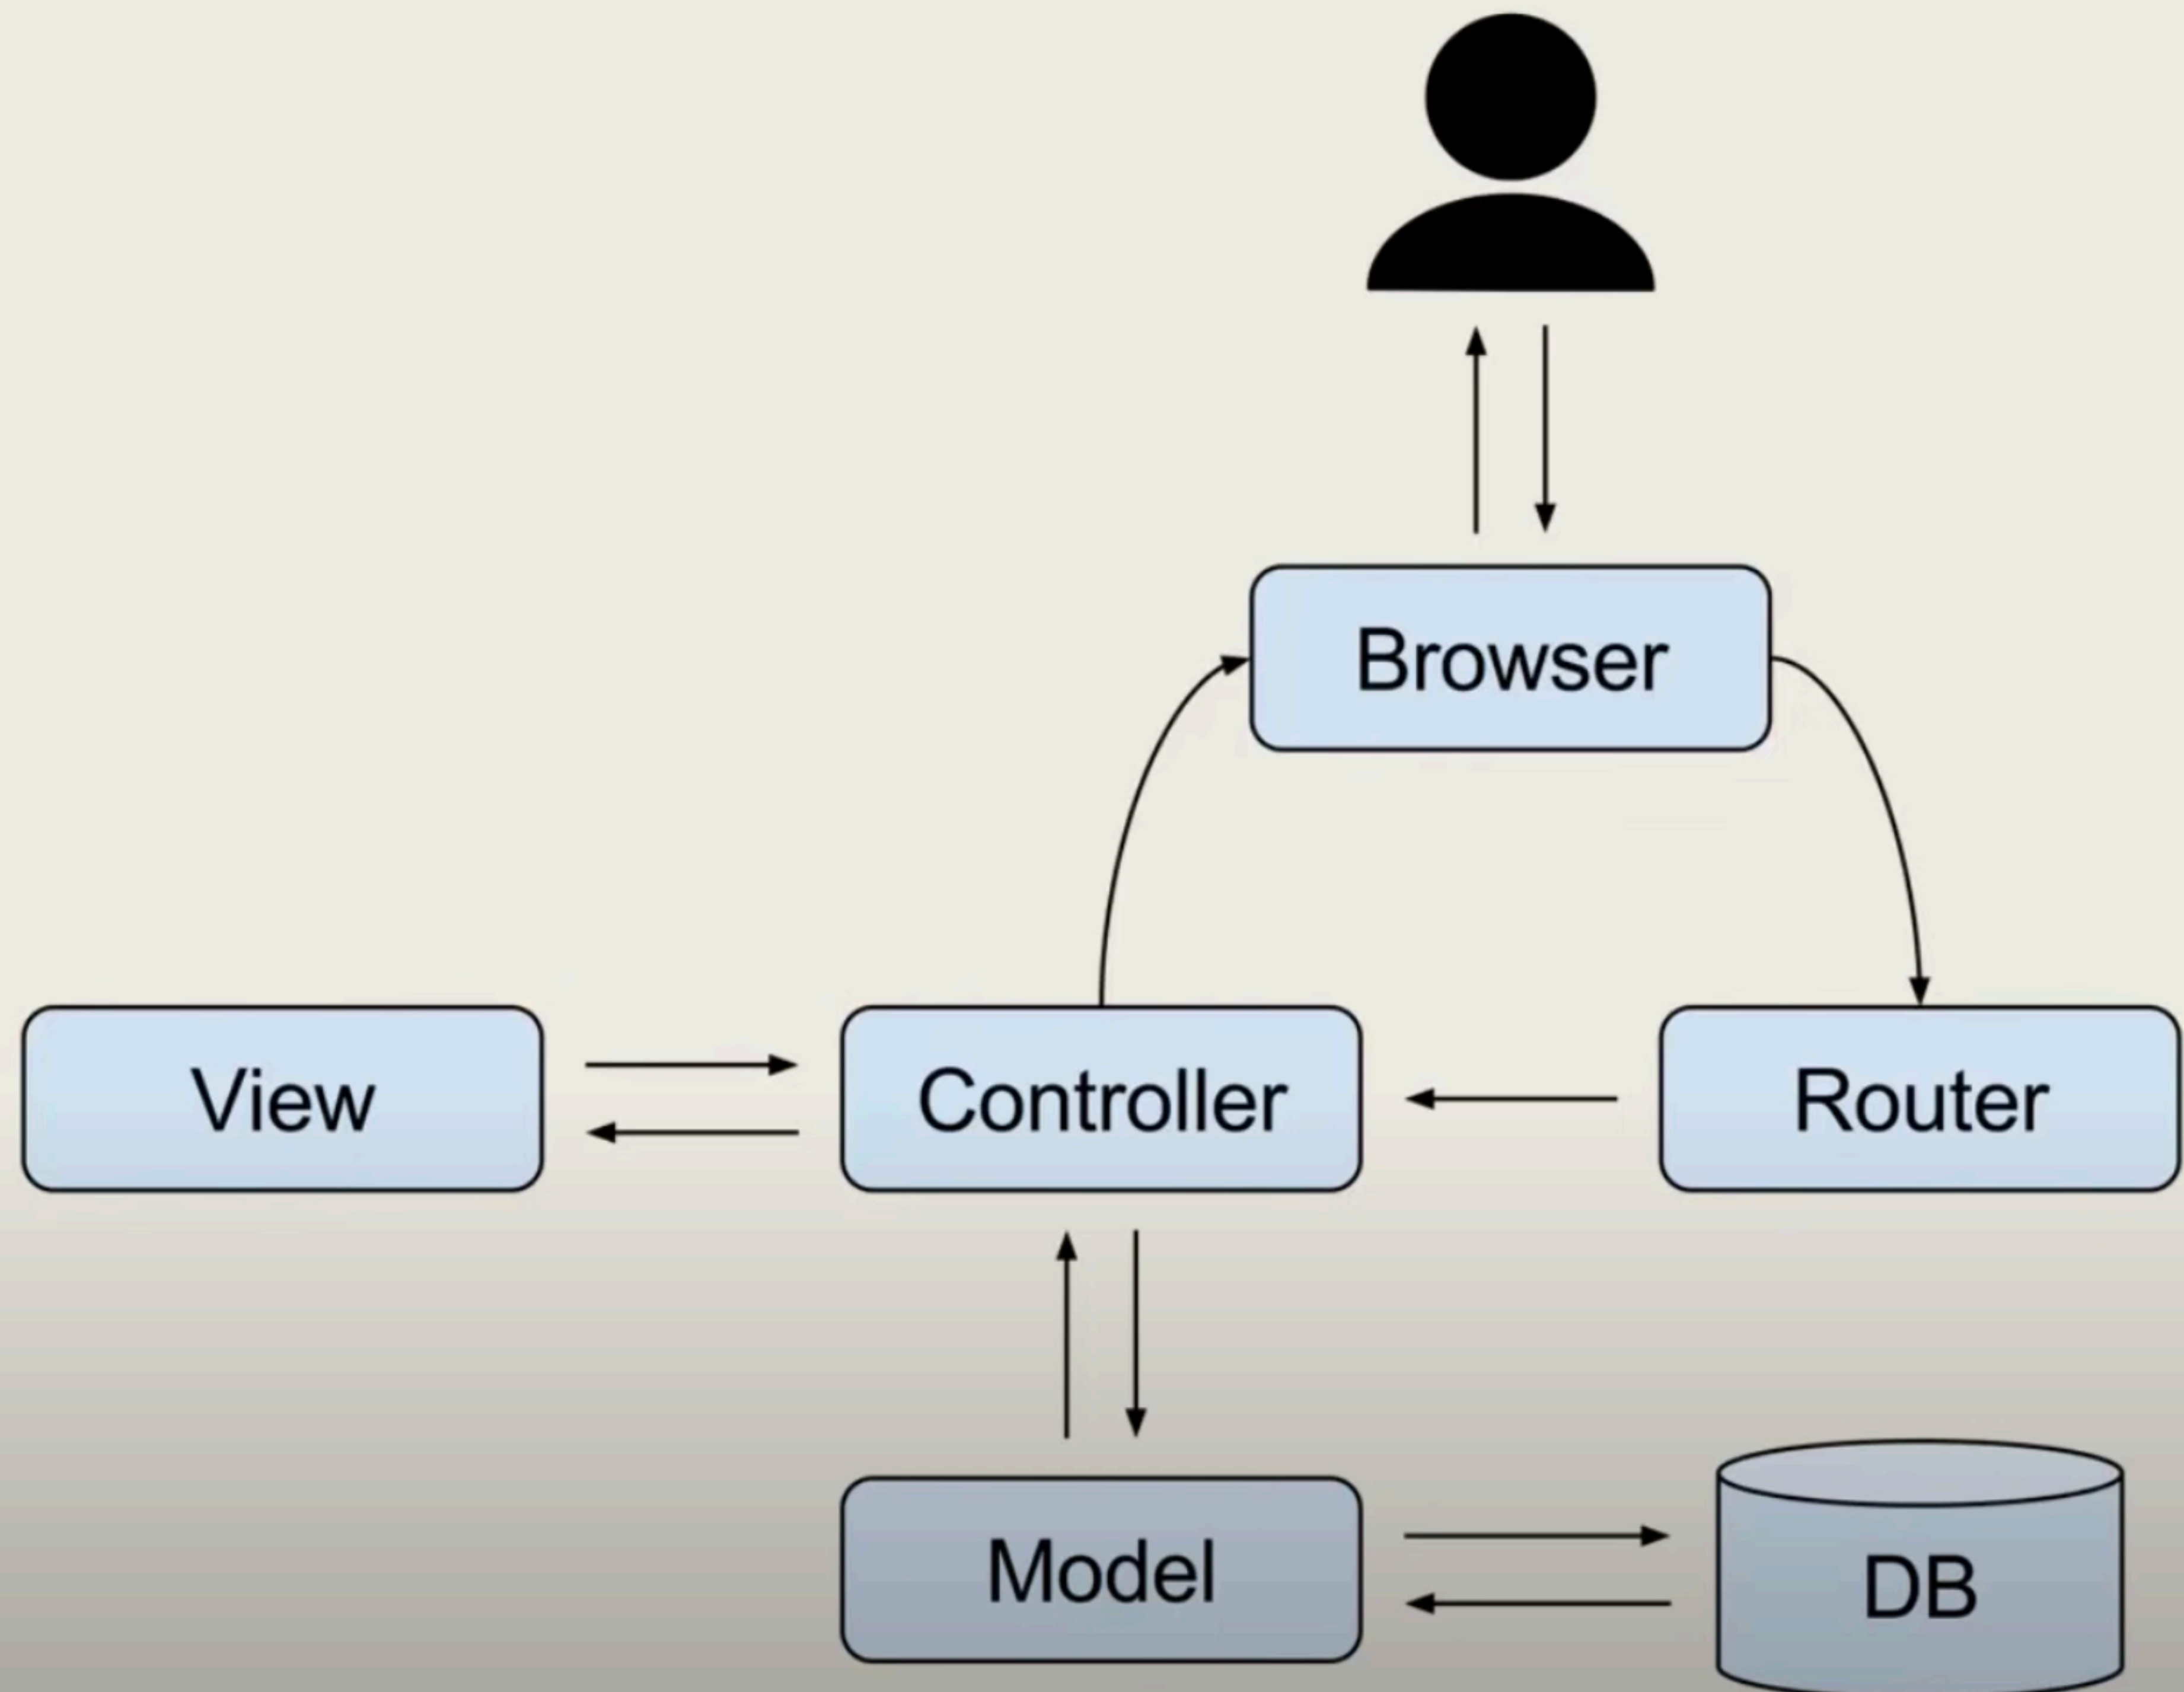

Some web frameworks that use MVC Concepts

- Ruby on Rails (Ruby)
- Sinatra (Ruby)
- Laravel (PHP)
- Codeigniter (PHP)
- Zend (PHP)
- Express (JS)
- Backbone (JS)
- Angular (JS)
- Django (Python)
- Flask (Python)

Also, **Symfony (PHP)**

MVC - Flow

Why use PHP Framework?

- Fast development
- Less code to write
- Collaboration and Teamwork
- Easier to maintain
- Secure

Communities inside PHP

<https://bit.ly/trends-php-groups>

<https://unelma.io/nilk3>

<https://trends.google.com/home>

Modern PHP Frameworks

Most popular

- Laravel
- Symfony
- CodeIgniter

<https://laravel.com/>

<https://symfony.com/>

<https://codeigniter.com/>

Less popular

- Yii framework
- Cake PHP

Lesser-known

- Utopia-PHP
- RhinoPHP-framework (who created this one, any guess?)

<https://github.com/utopia-php/framework>

Some websites that use Laravel framework

- BBC
- Pfizer
- 9GAG
- Unelma.IO

Some websites that use Symfony framework

- Spotify
- Dailymotion
- Vogue France / Netherland
- Doc Planner
- BlaBlaCar

VS Code Extensions (optional)

- PHPDoc Comment
- PHP Namespace Resolver
- HTML Snippets
- JavaScript (ES6) code Snippets
- Symfony code snippets And Twig Support & Yaml
- Symfony for VSCode
- Twig Language
- Twig
- Twig Language 2
- Emmet Live

Composer - What is it?

A dependency manager for PHP

<https://getcomposer.org/>

Composer - Installation

Go to [GetComposer.org](https://getcomposer.org), click “Download”, then copy one of the two code blocks depending if you have `curl` installed.

```
$ curl -s https://getcomposer.org/installer | php
```

Browse packages

<https://packagist.org/>

You can search for many packages (just like in npm)

Go and search for “rhinophp”

Composer - Walkthrough

Create an empty folder e.g.

```
mkdir composer-learning
```

```
cd composer-learning/
```

Go to → <https://packagist.org/>

Search “rhinophp” and download it by executing the following command:

```
composer require rhinophp/rhinophp
```

Open the composer-learning folder in VS Code

Browse through the folders and files

Composer - Walkthrough

Search “skeleton” and download it by executing the following command:

```
composer require symfony/skeleton
```

Open the composer-learning folder in VS Code

Browse through the folders and files

See how the vendor folder has changed!

See composer.json file

```
{  
    "require": {  
        "rhinophp/rhinophp": "^1.0",  
        "symfony/skeleton": "^6.0"  
    }  
}
```

What is Symfony?

Symfony is a set of reusable PHP components and a PHP **framework** to build web applications, APIs, microservices and web services.

<https://en.wikipedia.org/wiki/Symfony>

Who created Symfony?

Original author: Fabien Potencier
Symfony community

<https://github.com/fabpot>

Symfony - Installation

Download

<https://symfony.com/download>

Homebrew

```
$ brew install symfony-cli/tap/symfony-cli
```

Symfony - Let's check if we have a Symfony installed

Open terminal

```
symfony
```

```
symfony list
```

Symfony - Let's start a brand new Symfony App

Open terminal

```
symfony new myfirstapp
```

myfirstapp - name of our project

Open the myfirstapp project in VS Code and browse

So what did that `symfony new` command do?

Symfony - Let's start a brand new Symfony App

Open terminal / Go to your new topsecret project

```
git status
```

```
git log
```

Our entire project is very small actually, try this command:

```
git show --name-only
```

- How many files do you have?
- Not a lot of code actually

If you want to start fully-featured project, you can do that by running:

```
symfony new myfirstfullapp --webapp
```

Symfony - Let's start a brand new Symfony App

Open terminal / Go to your new topsecret project

```
Checking Symfony requirements
```

```
symfony check:req
```

Starting the local development server

```
symfony serve -d
```

Moment of truth! Copy the URL, spin over to your browser, hold your breath and woo!

Refresh the page few times

Symfony - Let's start a brand new Symfony App

127.0.0.1:8000

Never Stop Learning

Unelma Search

You're seeing this page because you haven't configured any homepage URL and [debug_mode](#) is enabled.

sf

Welcome to
Symfony 6.0.7

✓

/Users/sk/throwaway/topsecret/

Your application is now ready and you can start working on it.

Symfony - project structure

- config/ - Contains all configuration files such as routes, services and packages
- **migrations/** - Contains all doctrine migration class files
- src/ - Contains all PHP code
- **templates/** - Contains all Twig templates
- bin/ - Contains files for the bin/console command. Ex: php bin/console <command>
- var/ - Contains all automatically-created files like cache files and logs
- vendor/ - Contains all third-party libraries. These are downloaded via the Composer package manager
- public/ - It is the document root of the project where any publicly accessible files are contained

Symfony - how it works

Symfony-MAMP (useful later)

Symfony-MAMP is a set of docker images that include a starter kit for a MAMP stack

Steps

1. git clone <https://github.com/kalwar/Symfony-MAMP>
2. Follow installation instructions
3. cd Symfony-MAMP
4. Delete “web” folder, **rm -rf /web**
5. Create a new fresh symfony project i.e. symfony new web
6. **cp .env.example .env && cp web/.env.example web/.env**
7. **docker-compose up —build**
8. Check docker desktop
9. Check phpmyAdmin and Symfony 7
